BAB I TEORI DASAR

1. CFG

CFG atau Context Free Grammar adalah tata bahasa formal di mana setiap aturan produksi adalah dalam bentuk $A \rightarrow B$ di mana A adalah yang memproduksi, dan B adalah hasil produksi. Batasannya hanyalah ruas kiri adalah sebuah simbol variabel. Dan pada ruas kanan bisa berupa terminal, symbol, variable ataupun ε , Contoh aturan produksi yang termasuk CFG adalah seperti berikut ini:

$$X \rightarrow bY \mid Za$$

$$Y \rightarrow aY \mid b$$

$$Z \rightarrow bZ \mid \varepsilon$$

CFG adalah tata bahasa yang mempunyai tujuan sama seperti halnya tata bahasa regular yaitu merupakan suatu cara untuk menunjukkan bagaimana menghasilkan suatu untai-untai dalam sebuah bahasa. CFG perlu disederhanakan dengan tujuan untuk melakukan pembatasan sehingga tidak menghasilkan pohon penurunan yang memiliki kerumitan yang tak perlu atau aturan produksi tak berarti

2. CNF

Bentuk normal Chomsky / Chomsky Normal Form (CNF) merupakan salah satu bentuk normal yang sangat berguna untuk Context Free Grammar (CFG). Bentuk normal Chomsky dapat dibuat dari sebuah tata bahasa bebas konteks yang telah mengalami penyederhanaan yaitu penghilangan produksi useless, unit, dan ɛ. Dengan kata lain, suatu tata bahasa bebas konteks dapat dibuat menjadi bentuk normal Chomsky dengan syarat tata bahasa bebas konteks tersebut:

- Tidak memiliki produksi useless
- Tidak memiliki produksi unit
- Tidak memiliki produksi ε

CNF adalah CFG dengan setiap produksinya berbentuk:

$$A \rightarrow BC$$

 $A \rightarrow a$

Langkah-langkah pembentukan bentuk normal Chomsky secara umum sebagai berikut:

- Biarkan aturan produksi yang sudah dalam bentuk normal Chomsky
- Lakukan penggantian aturan produksi yang ruas kanannya memuat simbol terminal dan panjang ruas kanan > 1
- Lakukan penggantian aturan produksi yang ruas kanannya memuat > 2 simbol variabel
- Penggantian-penggantian tersebut bisa dilakukan berkali-kali sampai akhirnya semua aturan produksi dalam CNF
- Selama dilakukan penggantian, kemungkinan kita akan memperoleh aturan-aturan produksi baru, dan juga memunculkan simbol-simbol variabel baru

3. CYK

Cocke–Younger–Kasami-Algorithm (CYK atau CKY) adalah algoritma penguraian yang sangat efisien untuk *context free grammar*. Ini membuatnya ideal untuk menentukan masalah kata untuk tata bahasa bebas konteks, diberikan dalam bentuk normal Chomsky (CNF). Alat berikut dapat digunakan untuk memeriksa apakah kata tertentu $w \in \Sigma$ adalah bagian dari bahasa, diberikan dalam tata bahasa CNF.

Secara informal, algoritma bekerja sebagai berikut: Pada langkah pertama, tulis kata di baris pertama dan tambahkan setiap simbol non-terminal di baris di bawahnya yang menyimpulkan simbol terminal. Setelah itu, untuk setiap sel di grid mulai secara vertikal di atas dan turun menuju sel yang akan diperiksa dan sel kedua secara diagonal. Untuk setiap langkah tersebut, gabungkan sel dan periksa apakah kombinasi tersebut muncul di tata bahasa. Jika ya, tambahkan non-terminal sisi kiri ke sel kisi. Jika setelah semua langkah, simbol awal terdapat di baris terakhir, kata tersebut dapat diturunkan dengan tata bahasa yang diberikan.

BAB II FA DAN CFG

2.1 FA

```
['start', 'else', 'dead'],
['start', 'number', 'dead'],
['start', 'lowerCase', 'final'],
['start', 'upperCase', 'final'],
['start', 'specialSign', 'final'],
['final', 'else', 'dead'],
['final', 'number', 'final'],
['final', 'lowerCase', 'final'],
['final', 'specialSign', 'final'],
['dead', 'else', 'dead'],
['dead', 'lowerCase', 'dead'],
['dead', 'lowerCase', 'dead'],
['dead', 'upperCase', 'dead'],
['dead', 'specialSign', 'dead'],
```

Pada representasi FA ini:

Setiap elemen pertama list melambangkan current state Setiap elemen kedua list melambangkan input simbol yang diterima Setiap elemen ketiga list melambangkan state yang dituju setelah FA menerima input simbol.

BAB III SPESIFIKASI TEKNIS PROGRAM

Program yang kami buat adalah program yang akan mengecek syntax bahasa Javascript berbasis Command Line Interface (CLI). Program kami menggunakan Context Free Grammar, Chomsky Normal Form, dan Cocke-Younger-Kasami serta FA yang telah dipelajari pada mata kuliah Teori Bahasa Formal dan Otomata. Kami telah mentranslasikan syntax Javascript dalam bentuk Context Free Grammar. Grammar tersebut kemudian diubah dalam bentuk CNF dengan menggunakan program \Leftrightarrow . Setelah grammar dalam bentuk CNF dan algoritma CYK tersedia, maka proses parsing akan dimulai.

Program akan menerima sebuah file Javascript yang berisi kode-kode. Program kami akan membaca setiap line dalam kode tersebut dan mengecek apakah ada *error* dalam *syntax* dari kode-kode tersebut. Alur kerja program utama adalah sebagai berikut:

- Pengecekan terhadap ada atau tidaknya file input sebelum dibuka, jika ada maka akan lanjut ke langkah 2
- 2. CFG akan di load dan diubah menjadi CNF lalu disimpan dalam suatu file txt.
- 3. File input akan per line dan setiap line akan diubah menjadi list berisi terminal
- 4. List terminal lalu dicek dengan menggunakan CYK
- Jika CYK berhasil melakukan parsing terhadap list terminal, akan dilakukan handling terhadap kata-kata kunci keywords dan curly brackets dari codeline untuk menghindari kesalahan dalam sintaks antar line yang tidak dapat dikenali oleh CYK.
- Jika file lulus uji sintaks, maka akan menampilkan pesan bahwa sintaks diterima.
 Sedangkan jika tidak, akan ditampilkan line letak kesalahan dan pesan bagaimana error terjadi.

BAB IV IMPLEMENTASI DAN PENGUJIAN

4.1 Fungsi-fungsi program dan headernya

4.1.1 Algoritma CYK

4.1.1.1 findRules(charItem)

Prosedur findRules mencari rules dari inputan string yang diterima

4.1.1.2 initArray(tWord)

Prosedur initArray menerima sebuah string (kalimat) dan membuat sebuah matriks berdasarkan jumlah kata

4.1.1.3 parseFirst(tWord,Array)

Prosedur parseFirst mengecek baris pertama dalam matriks

4.1.1.4 getDiag(array,possibleProductions,currentLength,currentHeight,length,i,diagList)

Prosedur getDiag mendapatkan item-item yang berada pada sel (dalam matriks) diagonal

4.1.1.5 getDown(array,possibleProductions,currentHeight,currentLength)

Prosedur getDown akan mendapatkan item-item menurun ke bawah mulai dari baris dimana pencacah berada

4.1.1.6

checkCombinations(array,possibleProductions,diagList,currentLength,currentHeight)

Prosedur checkCombination berfungsi untuk memproduksi antara diagList dengan possibleProduction

4.1.1.7 parse(tWord,array,i)

Prosedur parse akan mem-parsing matriks

4.1.2 Algoritma CFG menuju CNF

4.1.2.1 load grammar as list(input string:filename)

Fungsi load_grammar_as_list menerima input nama file grammar yang akan dibaca. Setiap rule pada grammar di filename kemudian dibaca dan disimpan sebagai tuple dari left-hand side dan right-hand side. Tuple-tuple tersebut disimpan pada suatu list dan list inilah yang dikembalikan oleh fungsi ini.

4.1.2.2 is terminal(input string:rule)

Fungsi is_terminal akan mengembalikan true jika rule berupa terminal dan false jika tidak.

4.1.2.3 insert rule(rule)

Prosedur insert_rule akan memasukkan rule ke global dictionary CFG. Apabila LHS sudah ada pada dictionary CFG maka akan RHS akan ditambahkan sebagai value pada CFG. Jika LHS belum ada pada dictionary CFG, maka akan diinisialisasikan key LHS pada dictionary kemudian ditambahkan RHS sebagai value dari LHS.

4.1.2.4 prosedur load_grammar_as_cnf(input string:filename, <optional> input write_to_file)

Prosedur load_grammar_as_cnf menerima input filename. Grammar pada filename kemudian dibaca dan disimpan pada dictionary CFG sebagai global variable sesuai dengan Chomsky Normal Form, Apabila pengguna memasukkan write_to_file = True, maka hasil konversi grammar dalam bentuk CNF akan dituliskan dalam file .txt.

4.1.3 Algoritma FA

4.1.3.1 convertInputSymbol(char)

Menerima suatu karakter dan mengubahnya menjadi input simbol yang dapat diterima oleh FA

4.1.3.2 transitions(currentState, inputSymbol)

Mengembalikan state yang dituju jika FA menerima currentState dan inputSymbol

4.1.3.3 checkWithDFA(varName, stringStack)

Mengecek apakah varName bisa diterima oleh suatu FA dan mengembalikan stringStack untuk mengecek apakah sedang di dalam string atau tidak

4.2 Pengujian

4.2.1 Testcase 1

```
program to solve quadratic equation
let root1, root2;
let a = prompt("Enterthefirstnumber");
let b = prompt("Enterthesecondnumber");
let c = prompt("Enterthethirdnumber");
let discriminant = b * b - 4 * a * c;
if (discriminant > 0) {
   root1 = (-b + Math.sqrt(discriminant)) / (2 * a);
   root2 = (-b - Math.sqrt(discriminant)) / (2 * a);
   console.log('Therootsofquadraticequationareroot1danroot2');
else if (discriminant == 0) {
   root1 = root2 = -b / (2 * a);
   console.log("Therootsofquadraticequatioareroot1androot2");
```

Hasil Pengujian:

PS C:\Users\user\Documents\Kuliah\Semester 3 Jurusan\Teori Bahasa Formal & Automata\Tubes_TBF02022\src> python main.py testcase2.js Syntax accepted

4.2.2 Testcase 2

```
if (true) {
    print("salomo")
    let i = 0
    while (i < 2) {
        print(i)
        if (i == 3) {
            break
        }
        i++
    }
}
else {
    print("egi")
}</pre>
```

Hasil Pengujian:

PŚ C:\Users\user\Documents\Kuliah\Semester 3 Jurusan\Teori Bahasa Formal & Automata\Tubes_TBF02022\src> python main.py testcase1.js Syntax accepted

4.2.3 Testcase 3

```
try {
    switch (x) {
        case 1:
            print("oke")
            break
        case 2:
            print("notoke")
        default:
            print("baik")
            throw 10;
    }
}
catch
    print("this")
```

}

Hasil Pengujian:

PS C:\Descr\bocuments\Kuliah\Semester 3 Jurusan\Teori Bahasa Formal & Automata\Tubes_TBF02022\src> python main.py testcase1.js Syntax error at line 15

READED: CURFEW_CLOSE
Error : Curly bracket not closed

BAB V PENUTUP

1. Kesimpulan

Kami berhasil membuat program yang dapat mendeteksi kebenaran dari suatu sintaks bahasa pemrograman. Disini, kami membuat CFG berdasarkan sintaks bahasa pemrograman Javascript (Node.js) dan mengubahnya menjadi CNF. Setelah diubah menjadi CNF, bahasa tersebut di-*parse* dengan menggunakan CYK. Meskipun kompleksitas algoritma CYK membuat program bekerja lebih lambat, namun implementasinya sebenarnya lebih mudah untuk dimengerti dan dibuat. Banyak juga cara untuk merepresentasikan finite automata, salah satunya adalah dengan menggunakan array di dalam array seperti yang kami gunakan.

2. Saran

Diperlukan algoritma parsing yang lebih efektif dan efisien untuk mengecek sintaks dari suatu program dibandingkan CYK agar program utama dapat berjalan dengan lebih lancar. Selain itu, perlu pendalaman dan pencarian referensi juga agar dapat menghasilkan representasi FA yang lebih maksimal.
